GENERAL INFORMATION:

APPLICAMT: ROSETTA GENOMICS LTD

TITLE OF INVENTION: GENES AND USES THEREOF

FILLE REFREENCE: 06087.0300 PCUSA3

CURRENT APPLICATION NUMBER: US/10/536,560

CURRENT PILING DATE: 2005-05-26

NUMBER OF SEQ ID NOS: 424571

SEQ ID NO 26233

LENGTH: 32
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 32;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence Sequence 6

The TCR of the invention has cytostatic and appoint activity. The products of the invention has cytostatic and appoint activity. The products of the invention are useful for treatment, prevention and diagnosis of had2-associated diseases, particularly tumours and leukaemia, including use for passive or active immunisation. They can also be used to screen for therapeutic agents. This sequence enocodes the polylinker Scal-Li-(Bsgl-Scal) fragment used in the construction of the fusion constructs described in the disclosure of the invention
chains of a TCR that include the antigen-recognizing sequence (ARS) of
                                   antibody specific for aa 81-88 of hdm2 (or its complex with HLA-A2-specific antibody) and a method for identifying hdm2-specific antigens

Quantitating target sequences for e.g. diagnosis, comprises exponentially amplifying a target to form exponential amplicons, and linearly amplifying exponential amplicons to form linear amplicons.

Example 2; SEQ ID NO 22; 34pp; English

The present nucleic acid sequence was used in the current invention relating to quantitating target sequences by exponentially amplifying sequences in a reaction that terminates when a selected number of exponential amplicons are produced, linearly amplifying an exponential amplicons to produce linear amplicons in coupled reactions that produces a detectable signal proportional to a linear amplicon, and measuring fluorescence signals as a function of the amplification cycle number. The invention further relates to obtaining a cycle number (Ce) and a copy number of a nucleic acid amplification reaction by exponentially and linearly amplifying a target sequence in a coupled reaction under conditions in which the exponential amplification terminates before reaching a plateau and a reporter molecule generates a detectable signal

```
proportional to the number of linear stranded amplicons, measuring the detectable signal as a function of cycle number, and obtaining from it the Ce value of the amplification reaction. The detectable signal is produced by a reporter molecule, where the reporter molecule is a self-cycling reaction comprising froward and reverse amplification cycling reaction comprising forward and reverse amplification primers, hydrolyzable probe. The target sequence is amplification primers, hydrolyzable probe and thermostable polymerase having 5'-3' nuclease activity, where the forward primer is in excess of the reverse cycling reaction by a least 50:1, the probe hybridizes to a target sequence 3' relative to the forward primer, where the conditions of the reaction are effective for the forward primer, probe, and target sequence to form a substrate for the nuclease activity and for the nuclease activity to hydrolyze the probe to generate the detectable signal. The melting the temperatures (Tm) of the forward primer, reverse primer and probe with the target sequence are 5 degrees C or less. The conditions terminate the exponential phase at or before the cycle number that the exponential phase at or before the cycle number that the exponential phase is capable of producing a detectable signal. The method is useful for amplifying one or more target polymucleotide sequences of an unknown polymer accurately, senaltively and specifically with high throughput the propert or property to the property and specifically with high throughput the property are not before the cycle in the property accurately, senaltively and specifically with high throughput
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          69 TCTGGATGCAGAGTCCTCTGACTCCCTCTGCCACGGGCTGAGTTTCCGGCTCCAGGTTCG 128

exponential amplicons are produced, linearly amplifying an exponential amplicons are produced, linearly amplifying an exponential amplicons are produced, linearly amplifying an exponential amplicon to produce linear amplicons in coupled reactions that produces a detectable signals as a function of the amplification cycle number. The invention further relates to obtaining a cycle number (Ce) and a copy number of a muleic acid amplification reaction by exponentially and linearly amplifying a target sequence in a coupled reaction under conditions in which the exponential amplification terminates before reaching a plateau and a reporter molecule generates a detectable signal proportional to the number of linear stranded amplicons, measuring the detectable signal as a function of cycle number, and obtaining the ce value of the amplification reaction. The detectable signal is produced by a reporter molecule, where the reporter molecule is a self-cullease or flap hydrolyzable probe. The target sequence is amplification at thermal cycling reaction comprising forward and reverse amplification at thermal cycling reaction comprising forward and reverse amplification are concluses eactivity, where the forward primer is in excess of the reverse concluses eactivity, where the forward primer is in excess of the reverse concluses eactivity, where the forward primer; probe, and target sequence to form a substrate for the muclease activity and for the nuclease activity to the probe to generate the detectable signal. The method is useful to the target sequence are 5 degrees C or less. The conditions terminate the exponential phase at or before the cycle number that the exponential phase at or before the cycle number that the exponential phase at or before the cycle number that the exponential phase at or before the cycle number that the exponential phase at or before the cycle number that the tendence or annifering a detectable signal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          for amplifying one or more target polynucleotide sequences of an unknown polymer accurately, sensitively and specifically with high throughput capacity using array based assays or by single-strand conformational analysis, and in diagnosis or testing. Log-linear amplification may be used to produce templates for nucleic acid sequencing or for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genesis and gene expression analysis. Note: The present sequence is shown in the patent but is a version of AEG19875 in the reverse (5'
                                                                                                                                                                                                        quantitating target sequences by exponentially amplifying a reaction that terminates when a selected number of
                                                                                                                                                   sequence was used in the current invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mutagenesis and gene expression analysis.

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore bused to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; 88.

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether progression of prostate cancer; (b) monitoring the progression of prostate cancer; (b) monitoring the progression of prostate cancer; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of an inhibit prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (g) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cancer; cytostatic; carcinogen; pharmacodyanamic marker; marker; gene; ss.
                                                                           Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             174 GGAGGGGGGGGAGAGAGAGGGGCTCTGGCCCCTTAATTGTACTTCGGGCTCGTATTGT

                                                                                               The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether progression of prostate cancer: (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit in prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the

cc cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diesease associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome comparable to the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and Pcc carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027

Transcription factor-related array hybridisation probe - SEQ ID No 145. BP.

Probe, ss, transcription factor-protein complex, transcription factor, drug screening, drug identification, array hybridisation.

08-JUN-2001; 2001US-00877243. 08-JUN-2001; 2001US-00877403. 08-JUN-2001; 2001US-00877705. 08-JUN-2001; 2001US-008477738. 30-MAY-2002; 2002WO-US017408

Identifying transcription factor-protein complexes, by isolating transcription factor complexes from sample based on a specific type of factor, and identifying different proteins present in isolated complexes.

The invention comprises a method for identifying complexes between a transcription factor and another protein. The invention also comprises method for isolating DNA probes which bind to activated transcription

```
factors. The methods of the invention are useful for identifying transcription factor-protein interactions. The methods of the invention are also useful for facilitating the screening and identification of new drugs, characterising their mechanism of action and screening for adverse side effects based on drug's impact expression. The present DNA sequence represents a probe used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       109 AGTITCCGGCTCCAGGTTCGCGTGTCGCCCTGAGGTTTGAGGCCAGACAGCTCGCAGTCG 168

obtaining cDNAs and genomic DNAs that correspond to 5' ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for

Claim 1; SEQ ID NO 15065; 71pp + Sequence Listing; English.

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 3' untranslated region (UTR) sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forenaic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors

                                                                         containing many identical probes. The probes are nucleotide sequences of 10-80 bases, are prepared ex situ from synthetic oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia (oli K12. The biochip is used for specific detection of gene expression in K12 and for determining the gene expression pattern, e.g. for diagnostic determination of which E. coli strains are present in the gut, biochip provides as comprehensive as possible detection of the K12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 shorter than probes prepared by polymerase chain reaction. ACD68731 to ACD81540 represent oligonucleotide probes used with the biochip described
                                                                                                                                                                                                                                                                                                                                                           genome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and
                                                                                                                                                                                                                                                                                                                                                                                                                                                           quantitative information about gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligonucleotides for preparation of probes allows free variation in probe length and ensures high purity (and thus selectivity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              reactivity and reproducibility; also synthetic probes are generally shorter than probes prepared by polymerase chain reaction. RESULT 11

New strains of microorganisms that produce 2-amino-4-alkylthio-butyric acid, useful for preparing L-methionine, from simple carbon source and a mercaptan or its salt, have modified methionine synthase activity.

Example 1; SEQ ID NO 9; 68pp; French.

containing many identical probes. The probes are nucleotide sequences of 30-80 bases, are prepared ex situ from synthetic oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading-frame (orf) of Escherichia coli K12. The biochip is used for specific detection of gene expression in K12 and for determination the gene expression pattern, e.g. for diagnostic determination of which E. coli strains are present in the gut, and to determination of which E. coli strains are present in the gut, biochip provides as comprehensive as possible detection of the K12 genome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     quantitative information about gene expression, it also allows measurements of population densities for the various strains. The use of synchetic oligonucleotides for preparation of probes allows free variation in probe length and ensures high purity (and thus selectivity, reactivity and reproducibility); alwershiptic probes are generally shorter than probes prepared by polymerase chain reaction. ACD88731 to ACD81540 represent oligonucleotide probes used with the biochip described
                                                                                                                                                                                                                                                                                                                                                                                                              Biochip containing probes complementary with open reading frames in Escherichia coli K12, useful for detecting gene expression and expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CACGGGCTGAGTTTCCGGCTCCAGGTTCGCGTGTCGCCCTGAGGTTTGAGGCCAGAC 156

cystathionine-gamma-synthase or an acylhomoserine sulfhydrylase, and is modified so that the substrate is reacted with (II) rather than with Licysteine, to result in preferential conversion of the substrate to (I) or homocysteine. The present sequence was used in an example from the
                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a novel strain (A) of a microorganism which produces a 2-amino-4-alkylthio-butyric acid (I) by metabolising a simple sugar and a thiol (II), or its salt, and has at least one gene encoding an enzyme with modified methionine synthase (MS) activity. (A) are specifically used for fermentative production of L-methionine, which is produced from a simple carbon source and alkylmeraptan, i.e. metaported from a simple carbon source and alkylmeraptan, i.e. metaported is a toxic waste product from the petrochemical industry and synthesis of L-Met occurs in a single step from O-(acetyl or succinyl). L-homoserine. The enzyme with modified MS activity is either
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100 CACGGGCTGAGTTTCCGGCTCCAGGTTCGCGTGTCGCCCTGAGGTTTGAGGCCAGAC 156

(A) with modified metabolic pathways comprising: (a) genetic modification of a microorganism to inhibit production or consumption of a metabolite when it is grown on a defined medium, thus affecting its ability to grow; (b) growing the modified organism in the defined medium so that evolution can occur, optionally with addition of a co-substrate to allow evolution; and (c) selecting as (A) cells able to grow on the medium, optionally in presence of co-substrate. The evolved microorganisms (A), or evolved proteins (I) expressed by them, are useful in biotransformation processes, especially those involving NADH-dependent enzymes, particularly synthesis of amino acids (Met, Cys, Thr, Lys or Ile) but constructed more efficient production of selected metabolism of sugars. (A) provide more efficient production of selected metabolites than parent strains. This sequence represents a nucleic acid molecule used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                    invention relates to a method for preparing evolved microorganisms
                                                                                                                                                                                                  New evolved microorganisms with altered metabolic pathways, useful for production of amino acids, are selected as mutants able to grow defined media.
                                                                                                                Gonzalez B, Meynial-Salles I, Soucaille PNP,

```
New protein isolated from human embryonic brain useful for treating nerve degeneration diseases e.g. Parkinson's diseases and Alzheimer's disease.
                                                                                                                                                                                  (I) which has nootropic, neuroprotective, anticonvulsant, antiparkinsonian and antidiabetic activity. (I) is useful for treating nerve degeneration diseases e.g. Parkinson's disease, Alzheimer's disease, muscular hypoplastic lateral solerosis, Huntington's disease, brain infarction, diabetic neuropathy and traumatic nerve degeneration.
                                                                                                                                                                                                                                                                                               AAZ89256-Z89234 represent PCR primers used in the isolation and amplification of the human brain protein described in the method of the

APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Giordano, J.Y.
TITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.
Patent No. 6783961
Patent No. 6783961
CURRENT APPLICATION NUMBER: US/09/513,999C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bainbridge_M.N., Warren,R.L., Hirst,M., Romanuik,T., Zeng,T., Go,A., Delany,A., Griffith,M., Hickenbotham,M., Magrini,V, Mardis,E.R., Sadar,M.D., Siddiqui,A.S., Marra,M.A. and Jones,S.J.M. Analysis of the prostate cancer cell line LNCaP transcriptome using a sequencing-by synthesis approach
                                                                                                                                                            (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative
                                                                                                                                                                                                                                                                                                                                                                                  of pwD42 (gi|4732114|gb|AF129072.1) a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              adaptored vector DNA; and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Culture Collection, Bethesda, MD) were maintained in RPMI-1640 media (StemCell Technologies; Vancouver, BC) supplemented with 10% fetal bovine serum (FBS; StemCell Technologies) and incubated at 37C with 5% CO2. Cells at passage 38 were plated at a density of approximately 4X10 6 cells per T175 flask. Cells were serum-starved for 48 hours prior to treatment for 16 hours with 10 nM R1881 (PerkinElmer; Woodbridge, Canada). Cells were harvested and total RNA was extracted from the cells using TRIZOL Reagent (Invitrogen Life Technologies, Carlsbad, CA) following the manufacturer's instructions"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bainbridge, M.N., Warren, R.L., Hirst, M., Romanuik, T., Zeng, T., Go, A., Delany, A., Griffith, M., Hickenbotham, M., Magrini, V., Mardis, E.R., Sadar, M.D., Siddiqui, A.S., Marra, M.A. and Jones, S.J.M. // note="INCaP human prostate cancer cells (American Type Culture Collection; Bethesda, MD) were maintained in RMH: 1640 media (StemCell Technologies; Vancouver, BC) supplemented with 10% fetal bovine serum (FBS; StemCell Technologies) and incubated at 37C with 5% CO2. Cells at passage 38 were plated at a density of approximately 4x10% cells per T175 flask, Cells were serum-starved for 48 hours prior to treatment for 16 hours with 10 nM R1881 (PerkinElmer; Woodbridge, Canada). Cells were harvested and total RNA was extracted from the cells using TRIZOL Reagent (Invitrogen Life Technologies, Carlsbad, CA) following the manufacturer's instructions"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Yu., Wang, J., Lin, W., Li, S., Li, H., Zhou, J., Ni, P., Dong, W.,

Cells at Passage 38 were plated at a density of approximately 4x10°6 cells per T175 flask. Cells were serum-starved for 48 hours prior to treatment for 16 hours with 10 nM R1881 (PerkinElmer; Woodbridge, Canada). Cells using TRIZOL Reagent (Invitrogen Life Technologies, Carlsbad, CA) following the manufacturer's instructions"
